 **Liam Wilson** 2013-11-10 08:49:56 PST [Description](#)

Created [attachment 829877 \[details\]](#)
`canvas_banding_example.html`

User Agent: Mozilla/5.0 (X11; Ubuntu; Linux x86_64; rv:25.0) Gecko/20100101 Firefox/25.0 (Beta/Release)
Build ID: 20131028113308

Steps to reproduce:

Created test webpage (see attached). It attempts to create and display a Canvas with a width and height set exactly to the native resolution of the window. It does this using a meta viewport trick (injects some HTML in to the head of the document setting "initial-scale" to `1/window.devicePixelRatio`).

Actual results:

On my Nexus 7 (2012). It created a canvas of 853x469 (landscape). That is the wrong resolution (should be 1280*something). The example above sets the correct resolution in Chrome Android (but it too has banding artifacts suggesting something is still off, see: <http://code.google.com/p/chromium/issues/detail?id=317175>)

Expected results:

Should be able to create a Canvas which is exactly the same resolution as the native window. I've read lots of blog posts about this. They all contain horrible hacks that attempt to fix the problem (as does my example). All of these hacks don't quite work (like doing `canvas.width=screen.width*window.devicePixelRatio`, this cannot work right because `screen.width` is something like `Math.round(realwidth/window.devicePixelRatio)`)

It occurs to me that all these hacks would be unnecessary if I could just go `window.devicePixelRatio=1`

 **Kartikaya Gupta (email:kats@mozilla.com)** 2013-11-10 09:50:07 PST [Comment 1](#)

This is more or less a dupe of [bug 737090](#); the target-densitydpi meta-viewport attribute handled this use case but for reasons that are not really clear it was removed. It would probably be worthwhile to restart the discussion on the W3C mailing lists to bring this back or at least bring back some suitable replacement.
